

will give you my prescriptive on how to do it.  
From the back of the door, open about a  
quarter of the way, pick up and down on the  
can. No play, hinges are good. I find it is hi  
or low on the body line of the quarter

curbness on the rock. the door bolts will give  
you your in and out, but can give you a small  
amount of up and down. the bolts on the body  
give you hi and low, and a small amount of up  
and down. for your drop, I would loosen the  
bottom body bolts(one you have to access from  
behind) loosen up the upper hing, all but one  
bolt the one at the top. just crack that one to  
act as a pivot. pull it up and tighten up an upper  
and lower bolt and check. it usually takes a few  
times, to go down revers the order. In and out  
same theory. to bring the bottom out loosen all  
the bottom bolts, the top bolts all but one,  
crack that lat one and twist. go a little, check  
it and if need be repeat. yuo can remove the  
striker and re

adjust if the door is gutted  
you need to add weight to it. I think around 50  
pounds, you can use a chain or something
